In 2003, Autodesk purchased the software rights to some competitors and formed a separate company AutoCAD BV. AutoCAD BV continued to develop AutoCAD, and in 2005, Autodesk split AutoCAD BV into two companies, Autodesk and AutoCAD Holding. AutoCAD was later released as a web app. This article focuses on using the desktop version of AutoCAD, specifically the 2017 and 2019 releases. Creating a New Drawing AutoCAD draws on a two-dimensional (2D) surface called a project canvas, where you edit, view, and modify the appearance of any type of object or layer. The drawing space in AutoCAD consists of windows and frames, which can be resized, moved, and stacked. You can make additional copies of the drawing, or close down the drawing to hide it from view. A drawing is made up of layers, which are treated like sheets of paper on which a drawing is created. A layer is not a container of information, like a file on a hard drive, but instead is a container for objects and modifications, like a drawing on a piece of paper. Objects are the entities of interest in your drawing, such as buildings, a house, a person, or a dog. A named layer is one of the elements in a drawing; it is often displayed as a rectangle at the top of a drawing window. Layers are the mechanism by which an object can be edited, viewed, or modified, whether they are inserted into the drawing or they are viewed in the drawing. When you insert objects into a drawing, they are inserted on top of the previous objects in the drawing. By inserting objects on top of others, you build up the layers, one on top of the next. The layers are the mechanism by which objects can be edited, viewed, or modified. You can add objects to any layer that is displayed in the drawing window, but you can only view or modify the objects on the currently active layer. The layer you are editing determines what you can do to that layer and what you cannot. There are two types of layers: • Active layers. These are the layers that you are currently editing. You can view and modify objects on these layers. • Invisible layers. These are layers that you cannot view or modify. The objects on these layers are ignored or not included in the edits you make.

Methodically, the customization options are divided into Autocad LISP (Autocad Class Library, used to create and maintain classes that represent CAD objects and properties, such as lines, arcs and surfaces) Parametric Design (AutoCAD VBA or AutoCAD Architecture is one example of a parametric design application) Visual LISP AutoCAD.NET (not to be confused with Microsoft.NET Framework) LISP, Visual LISP, VBA AutoLISP (Autocad Class Library) AutoLISP is a high-level programming language, built on top of the Assembler dialect of the LISP programming language. Autocad commands are implemented as a class library. The command classes are then used in the AutoLISP environment. AutoLISP is used to automate repetitive CAD operations and to create custom-built macros. These custom macros can be easily shared between workgroup members. These macros help to standardize CAD tasks and reduce repetitive manual tasks. Example: (* Set the database for the drawing named "test.dwg". * The database is named "dwg" by default. * Define a new class named "Line" * The class can be used to draw lines in the drawing "test.dwg". * The class definition is stored in the database. *) (* Clear out any existing lines from the database, * and the "dwg" database. *) (* Use the "Line" class to draw a line. * The "Line" class implements "Line" commands. * The "Line" commands are stored in the "dwg" database. * The class name "Line" is stored in the database, * so we can use the class to draw lines. *) (* The following command tells the class library to draw a line * that goes from the intersection of the two lines, in the middle, * to the first line. *) (* Draw a Line from point (2,2) to (1,1) *) A: AutoCAD 2008 does not have any sort of plug-in architecture, the only options are Visual LISP, AutoLISP and the command line. The impact of PCRT on formal quality assurance process and reporting will be assessed. Ethics and dissemination {#s3}
===== A favourable ethical opinion was received from the NRES East Midlands-Lincolnshire Research Ethics Committee (Ref: 18/EM/0161). Patient/public involvement {#s3a} ----- A patient and public involvement (PPI) group has been established to support the project. The PPI group have been involved in the project design, research prioritisation and ethics submission. They will also help to evaluate the outcomes of the project and disseminate the findings. PPI members will be formally recognised in the research and publication outputs. Participant recruitment {#s3b}
----- A member of the research team will inform potential patients and their clinicians of the study. Patients will be provided with an information sheet about the study and will be asked to provide written informed consent prior to taking part in the study. Discussion and next steps {#s3c} ----- The study has been designed to explore the views and experiences of patients, their families, healthcare professionals and service commissioners to inform service delivery. This will be achieved by using mixed methods including interviews, focus groups, surveys and archival research. The study will examine the concept of family presence during the PCRT process. **Contributors:** BK and LMC are the project managers for this study. The other co-investigators are the project academic supervisors; CR, JG and JC are the health researchers for the project. The PPI group for this study are LK, MP, DP, MB and DP. The project managers will hold regular teleconferences with the PPI members to discuss project progress and to ensure the group's views are included in the project. **Funding:** This work is supported by the National Institute for Health Research School for Primary Care Research (NIHR SPCR). **Disclaimer:** The views and opinions expressed therein are those of the authors and do not necessarily reflect those of the NIHR, NHS or the Department of Health. **

Export markup into your project for review or sharing. Preview, organize, and share the exported symbols in your preferred format. (video: 1:53 min.) Open feedback in 2D or 3D. The next AutoCAD release will include new technology that will allow you to interact with comments, reviews, or answers directly in your drawing. (video: 1:18 min.) Quickly import any markups that you might have in the Cloud, a browser-based application, or a folder on your hard drive. (video: 1:22 min.) New styles from the Carsten Braun Workshop. Model parts and assemblies are included in this update. (video: 6:05 min.) Electrical Power Meters: New styles from the Carsten Braun Workshop. Some of these styles have been made available in previous releases of AutoCAD. (video: 1:37 min.) Macros for Text and Dimensions: New functionality for macros. This includes: the ability to skip an extra step when you don't want to place the dimensions in the view, an option to automatically place dimensions when you have "Full" (not "Shallow") views, and more. New and improved color gradients for curves and lines. New text styles from the Carsten Braun Workshop. Use of text styles may be disabled in preference settings. Material Attributes: Material attributes provide a convenient way to identify and assign a value to various parts of a model in a non-destructive way. Newly added material properties: Hatch, Color Fill, Color Stroke, Diffuse, Specular, Emissive, and Rake. Newly added material options for Hatch, Color Fill, and Color Stroke. Newly added material options for Diffuse, Specular, and Emissive. More flexibility for creating material properties. Refresh and Remove Material Attributes: Refresh and remove Material Attributes. Text Encoding Text Encoding is a feature that allows you to embed a character set in the text of your drawing that supports larger character sets than the default ASCII (American Standard Code for Information Interchange) or UTF (Unicode Transformation Format) encoding. Newly added text encodings: GBK (Simplified Chinese), ISO-2022-JP (Japanese), Shift-
