The diagnosis and management of patients with unstable angina pectoris are among the most challenging for the cardiologist. Clinical manifestations of unstable angina are nonspecific; therefore, the diagnosis is often based on the presence of a high level of cardiac ischemia as defined by clinical angiography. Although the information obtained with noninvasive testing is useful, cardiac ischemia is often detected only at the time of angiography. Angiography is the standard diagnostic test in patients with unstable angina pectoris; however, its invasive nature frequently leads to a mismatch between the intensity of treatment needed and the evidence base for treatment. These problems are particularly evident in patients with unstable angina who have no evidence of infarction or those who have a documented infarction but who have no evidence of ischemia. Despite the acceptance of the need for revascularization of coronary artery disease, not all patients respond to revascularization procedures. Although the identification of those who benefit and those who do not is difficult, current best evidence is that significant symptomatic and prognostic benefits can be obtained in patients with acute coronary syndromes, including unstable angina and noncardiac chest pain, provided that optimal treatments for cardiac ischemia are instituted.Q: How to do a background check on software online I've been doing a bunch of research for the last couple of months on the various security services, such as bug bounties, how to assess, etc. While I've come across plenty of resources on the internet, I've never actually been able to find a service that actually looks at the code of the software that I am going to be using, instead of relying on the description on the website. My understanding is that there are different services out there that do background checks on software that I'd actually want to use, so I'd like to know the names of any services in particular that I can use for specific purposes? I'd like to find out: Is there a
