these include call logs, text files, images, encrypted files, compressed files, pst files, microsoft office files (excel, word, powerpoint), pdf files, password files, registry files, html files, zip files, scripts (asx, vbs, vbs.dll), executables (winexe, exe, bat, vif, vvx, wsh, com, Ink, uat), media files (avi, dvd, vrd, mp3, wma), jpeg files, mp4 files, ntfs files, and pdf files. our detailed analysis of viruses sees each product (excluding the cloud versions) tested against all known viruses in the three sets, with data in the form of detection rates and errors gathered over the three weeks prior to the test deadline. for each virus set, this analysis is then repeated in the same form over the following week to give an indication of real-world detection and detection rates. the post-test analysis is based on information gathered from analysis of thousands of samples submitted to virustotal and also based on our own feedback of new viruses. in addition, we use a combination of search engines , and feedback from various security

bodies and independent security testers. a few minor changes in methodology are being made, the most important of which is a move away from the use of categories of products for the comparative data. this was not without issues, not least in that it led to a large number of products lumped together with no real understanding of what went on. for example, a large number of products were above 98 per cent in detection and 98 per cent in performance. the failure to account for these products simply as high or low performers only leads to uncertainties in making comparative statements. we do not consider adding to this as a solution to the issue, and therefore have decided to switch to a series of rankings for the comparative data, in which all products are ranked and then sub-ranked. ranging from a high of 1 to a low of 7 each, these are: detection (1=best detection, 7=worst detection); performance (1=best performance, 7=worst performance); and overall (1=best overall, 7=worst overall). the precise rankings

chosen for each area are difficult to define, as a mixture of factors is taken into account including performance and success in the real world. however, although they are not meant to replace individual product comparative tables, we do feel they provide a more complete reflection of how we rate the products.

a download link to the manual was provided on the file we downloaded from the download site, and opening it reveals a very nicely produced user manual with lots of useful information, such as tips to speed up online scans. it also has a wealth of information on possible virus names and file types, which can be a good place to start if you're new to detection and want to understand the nuances of the application. the manual is certainly of much better quality than other manuals we've encountered, and is well constructed and easy to read. our first impression of the arcavir product was that it is an exceptionally simple package, and it is certainly easy to use, although it will not be to everyone's tastes. during our period of observation with the file it would detect every single file it could find on the system, complete with all the results it could provide,

but the list of items detected was quite confusing. all detections are reported in a list, most with a date stamp, and there is also a summary list at the end, with all detections from the past few days added on. while it may take some time to learn the file types and specific items the product detects, the interface is certainly easy to use. the program itself is very simple, just a single executable, split into two sections, one containing the icon and main window of the application, and the other containing the search engine. all you need to do is to enter a search term to indicate what you want to find, select any files you want included, and the program will do its best to find them and add them to a list. for users familiar with the task at hand, we found that it took a while to get the most out of it. the search terms (for example, virus, worm or trojan) were case-sensitive and there were no field-specific searches available. the file-searching options were limited to the file's extension or file name, so short file names and file names

with spaces in them were a problem. some file extensions were not highlighted, such as virus (.exe) and worm (.bat) files. lastly, the ability to extend the search via a wildcard is well hidden, and an extra button needs to be pressed, so it's not as easy to use as it should be. the results showed why: most of the time it found nothing, reporting that no items matched the specified search terms. as most users likely have a few of the file types we have tested it on, these are listed in its search engine, which also displays the results from the last scan (over what time period and how many scans? these two details are not found on the initial screen).
