The Greenscreen tool in Photoshop CS6 is fantastic, but importing a 4:3 video source into Photoshop is not the best experience in terms of time and effort. It has a sturdy, intuitive workflow that allows you to draw and artfully tweak image elements as if you were working in a hardcopy drawing tablet. I asked a lot of questions about developing plugins and what to expect from the upcoming (at least on paper) Adobe photoshop CC. The response I got from the community of developers was very fast and eager to provide answers to my questions. One of those answers, was that the developer programmes are actually easier because of the lack of plugin support. And that is true. Not that this should be a problem, because there is a lot of instruction available online, but to write a plug-in, you need to analyze both the API documentation to a point where you start getting a sense of the total structure, how the API you are looking for works, as well as an understanding of how Photoshop manages to handle all of that. To me, this is still one of the greatest things about Photoshop as you have a very large number of features that you can develop for. You can even build your own plug-ins, but this is not very simple, since you need to build a bridge between the API and what Photoshop does. You can read books and tutorials to learn how and what Photoshop does, but to really understand how to code an API, you need to write your own installations before you try to convert it to a plug-in. All of this just shows that the development community is extremely active and very eager to help. But the impression I had from Adobe's forums is that this is not just a community in general, but a vast community of developers in specific.
