The photo jpeg preview looks like what a high-end camera would give. Very appealing. It's not just a small window on top of the image, but a full frame to examine the photo. While the app doesn't discriminate jpegs from RAW images, it does appear to be quite quick to work with it. LR 2012, and the new updates seem to have made a lot of crap faster. I'm a graphic designer so the tools and features are what I gravitate towards. I like how the clipping path works in improve my final product. Each layer and clipping path works with the image so its not part of the JPEG. I haven't found problems with the file sizes being smaller yet. My computer getting faster obviously speeds things up too. I've done a lot of editing in both Elements and Photoshop and I prefer Elements. Everyone I work with is having trouble getting used to the iPad/iPad Pro interface. This is a big step down in usage. They are missing the 360 degree view and product specific tweaks you would normally get from the desktop version. The iPad just does not have the functionality yet. The desktop version is much better for a lot of things. Filters out of the box. The crop tool is great but sometimes it seems to crop the eyes or tell me it is too close. Adding a new layer is fairly simple. The first step is to make sure that the "Layer" option at the top of the screen is selected. The next step is to make sure that the "New" symbol looks like one of the three squares at the bottom of the screen.

If you're a pro, there are a lot of useful new features available in Photoshop 2014. Some of the coolest new features include the option to downsample high-resolution images to work with smaller monitors, and a new "Save for Web" feature that enables you to save a layered Photoshop document as a single, optimized image that can be used on the web. See the full release notes for more on these and other new features. If you own an iPhone, iPad or are planning to upgrade to an iPad Pro, you might want to read this article. It discusses some of the new features they offer that might appeal to the design world as a desktop alternative: Adobe Photoshop is changing its look and feel in order to mimic its web font usage, and to standardize more of the UI. However, Adobe still hasn't fully committed their UI elements to a web-based approach, so you're still dealing with some boxes and not lines. The company is, however, counting on the shift in use for its business model, so the control panel is redesigned to match content, not a specific view.

Your computer may not have enough disk space available to successfully load several photo layers onto disk at the same time. RAID helps by allowing several drives to be used to hold large amounts of data without sacrificing performance or reliability. This service is available for about $30 per terabyte. Finding the right place to store your data is crucial. First of all, it should provide proper protection for the data so you can recover files in the event of a hard drive failure. And because you are going to store multiple materials that could potentially grow in size over time, it should be able to accommodate them without running out of space. The biggest benefit of RAID technology is that multiple hard drives can be used to cache data, ensuring that the data can be accessed quickly. In some cases, you may want to store several files in bulk to save on your hard drive space. RAID technology is simply a way of making several drives work together to take advantage of disk caching technology. It can also increase that drives reliability in the event of a hard drive failure. Once you're using a RAID array, you'll enjoy instantaneous accessibility to all your media while reducing the chance of file loss in the event of a hard drive failure.
