But that's another issue. Why can't Adobe keep the box design and make it easier for people to understand what the program is all about and what the difference is between Photoshop and Photoshop Elements? It's true that Photoshop Elements is a stripped version of the original Photoshop. But, are people actually going to buy this and get Photoshop by mistake? There is a lot of confusion out there. (This is exactly what I understand Youtube channels to be doing, by the way, deliberately making billions of dollars on advertising. "How could this be a good idea?" was one of my first questions after watching Google-based education videos dedicated to explaining the ins and outs of Youtube channels. Oh, it's a very lucrative business model, no doubt. But should it be taught in schools and universities?). In order to comment more effectively, you should keep these facts in mind: When you are in the middle of editing a photo, the picture may start to break down or stop at some points. Therefore, the person reviewing your photo often should be able to make comments without spoiling the image. Adobe Photoshop always comes with lots of tools for editing, but for advanced users, tools for more detailed editing may prove even more essential. The selection tools in Photoshop now show more status and context-sensitive information. Rounded corners are smoother and come in a variety of sizes, depending on how far out you drag the tool. White space is also visible around the selection. All these improvements would make it even easier to understand how much area a selected object encompasses.

Adobe Photoshop introduces several new features that are worth checking out. These features aren't found in Elements and range from adding text to fix bad spelling to simulating a digital paintbrush, so here's a look at a few of the top new features of Photoshop: Before you can duplicate a layer or enable a layer blend mode and give it a name, you need to open the Layers panel. There are many ways to do this. One way is to double-click on the layer thumbnail while you have the Layers panel visible. A new panel will drop out with the Layers panel open, and you will be able to see and work with the various layers. To duplicate a layer, simply drag in the duplicate icon at the top of the panels. Selecting this symbol selects the duplicate layer and moves it up one level in the Layers panel. You can now work with this duplicate layer the same way you would with the original layer. OK, here is a quick example. Note that you can now navigate as you would on the original layer. You can move, resize and rotate the duplicate layer. There is also a new panel on the right that lets you name the duplicated layer. You can use this new panel to give the duplicate a different name in order to keep the original layer and the duplicate separate. The duplicate layer it is now named Smart Sharpen with a checkmark, so the name of the original layer is now changed to Unsharp Mask. You can see a preview in the Layers panel. You can adjust the Sharpen setting on the new layer as you would on the original (or you can apply it to all layers).
